Loneliness across the lifecourse

Prof. Christina Victor

Brunel University London

#EndLoneliness
Overview of presentation

• Context for the study of loneliness
• The importance of stereotypes
• What do risk groups tell us?
• Reframing the study of loneliness: are we asking the right questions or developing the correct interventions?
Stereotypes of loneliness in later life

October 18th 2013 the Health Secretary Jeremy Hunt stated “it is a source of "national shame" that as many as 800,000 people in England are "chronically lonely", ; "Some five million people say television is their main form of company," and concluding that "A forgotten million who live amongst us - ignored to our national shame." His proposed solution for the problem of loneliness in later life was to emulate the ‘respect’ and explicit inter-generational solidarity he states is articulated within Asian countries and “that every lonely person has someone who could visit them and offer companionship”.

Campaign to End Loneliness

Failure to visit parents now a ‘crime’ in China

BEIJING: A Chinese law requiring family members to visit their elderly relatives went into effect to howls of online ridicule, as the country’s huge population ages rapidly.

The regulation “forces” children to visit their parents, the state-run Global Times newspaper said, with concerns growing over increasing numbers of “empty nest” homes.

China’s rapid development has challenged its traditional extended family unit, and reports of elderly people being neglected or mistreated by their children have shocked the country.

Last year a farmer in the eastern

A country actually legislates respecting its parents? This is simply an insult to the nation

— SINA WEIBO COMMENTER
This is not new....

“A distressing feature of old age is loneliness. All who have done welfare work among the old have found it the most common, if at the same time the most imponderable, of the ills from which the aged suffer, and its frequency was amply confirmed by our study”

(Rowntree, 1947,52)
Loneliness: A problem of old age?

Old age is a time of loneliness

I expect to become lonely

Loneliness at wave 5-8 years later
Trajectories of loneliness over time

In longitudinal studies with more than 1 follow up we can identify 5 distinct trajectories

- Never lonely
- Always lonely
- Increasing loneliness (new onset and increase in severity)
- Decreasing loneliness (out of loneliness or reduction in severity)
- Fluctuating pattern (if more than 2 follow up points)
### Trajectories of loneliness: Self rating scale

<table>
<thead>
<tr>
<th>Loneliness pathway</th>
<th>Changes over 10 years (%)</th>
<th>Changes over 1 year (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Never lonely</td>
<td>70</td>
<td>59</td>
</tr>
<tr>
<td>Always lonely</td>

<td>50.0%</td>
</tr>
<tr>
<td>Spring, W4</td>
<td>75.0%</td>
</tr>
<tr>
<td>Summer, W5</td>
<td>33.3%</td>
</tr>
</tbody>
</table>
Are we asking the wrong questions?

• Most people are not lonely in both cross-sectional and longitudinal studies

• Risk factor studies identify groups (e.g. the widowed) – can tell us who but not why

• Risk factors not homogeneous-why do some widows experience loneliness and others do not?

• Challenge the ageist stereotypes about loneliness?

• Loneliness not just a ‘problem’ for older people and not just at Christmas!
